

How to Build Your Page Structure

Use your 10 competitors to reverse-engineer the exact section order that Google is already rewarding

Where This Fits in the SEO Process

1	Site Structure	Which pages to build
2	SERP Behaviour Analysis	What format each page should take
3	Page Structure	How to lay out the content inside each page

You now know *which* pages to build and *what format* each one takes. This guide answers the final question: **what sections go inside each page, and in what order?**

The Key Insight

Every category of website tends to follow a section pattern that Google has already validated. For most service business home pages, the pattern looks like this:

Hero → About → Services → How It Works → Testimonials → FAQ → CTA → Footer

But this is only a starting point. The actual pattern for your niche may differ. Some industries lead with social proof. Some skip the How It Works section entirely. Some put the FAQ above testimonials. **You find the pattern by reading your competitors — not by guessing.**

At a Glance

#	Step	What you do
---	------	-------------

1	Pick One Page Type	Start with your most important page — usually the home page
2	Open All 10 Competitor Pages	Pull up the URLs you saved in your site structure research
3	Map Every Section Top to Bottom	List each section in order for every competitor
4	Find the Common Pattern	Identify sections that appear across 7 or more competitors
5	Spot the Gaps	Note sections that only 1–2 competitors have — potential edges
6	Build Your Page Blueprint	Write the final ordered section list for your page

Step-by-Step Walkthrough

Step 1 Pick One Page Type

Do not try to analyse every page type at once. Pick the single most important page for your business and complete the full process for that page before moving to the next.

For most businesses, start with:

- **Home page** — if your site is primarily about building brand and generating leads
- **Main service page** — if you offer one core service and want it to rank
- **Location page** — if you are targeting a specific city and the local pack is present

One page type at a time. Trying to map home page, service page, and blog post simultaneously creates confusion. Finish the blueprint for one page type, then repeat the process for the next.

Step 2 Open All 10 Competitor Pages

Go back to the competitor list you built during site structure research. For the page type you selected, open the equivalent page on each competitor's site. If you chose the home page, open each competitor's home page. If you chose the main service page, find and open that page on each competitor's site.

Open all 10 in separate tabs so you can switch between them easily while filling in your sheet.

Can't find their equivalent page? If a competitor does not have the page type you are analysing, skip them for this round. Focus on the competitors that do have it — those are the ones Google is actually rewarding.

Step 3 Map Every Section Top to Bottom

For each competitor page, scroll from the very top to the very bottom and list every distinct section you see in order. A section is any visually separate block of content with its own purpose.

Common section types to look for:

Section Type	What It Contains
--------------	------------------

Hero / Banner	Large top section — headline, subheadline, CTA button, often an image or video
About / Intro	Who the company is, their story, their mission — usually 1–2 paragraphs
Services	A grid or list of the services or products they offer
How It Works	A numbered step-by-step showing the customer journey
Features	Specific capabilities or differentiators, often with icons
Social Proof	Logos of clients, media mentions, or partner badges
Testimonials	Customer quotes, star ratings, case study snippets
Stats / Numbers	Key metrics like '500+ clients' or '98% satisfaction rate'
FAQ	Expandable questions and answers — often targets PAA keywords
Blog / Resources	Latest articles or guides to demonstrate expertise
CTA / Contact	A form, phone number, or button to start a conversation
Footer	Navigation links, legal pages, social icons, contact details

Create a new tab in your Google Sheet called **Page Structure**. Set up one column per competitor. Each row is a position in the page — row 1 is the top section, row 2 is the next section down, and so on.

Your sheet will start to look like this:

Position	Competitor 1	Competitor 2	Competitor 3	Competitor 4
1 (top)	Hero	Hero	Hero	Hero
2	Social Proof	About	Services	Stats
3	Services	Services	About	Services
4	Testimonials	How It Works	Testimonials	How It Works
5	FAQ	Testimonials	FAQ	Testimonials
6	CTA	FAQ	CTA	FAQ
7 (bottom)	Footer	Footer	Footer	Footer

Step 4

Find the Common Pattern

Once all 10 competitors are mapped, read across each row. Count how many competitors have each section type, and note the most common position it appears in.

The rule is simple:

- A section that appears in **7 or more** competitors is **essential** — include it, no exceptions
- A section that appears in **4 to 6** competitors is **recommended** — include it unless you have a strong reason not to
- A section that appears in **1 to 3** competitors is **optional** — consider it a potential differentiator

Pay attention to order, not just presence.

A section appearing in position 2 across 8 competitors tells you where Google expects to find that content. A testimonials section buried at position 7 on most sites means that is where visitors expect to find it too — moving it to position 2 could hurt trust.

Step 5

Spot the Gaps

Gaps are sections that only 1 or 2 competitors have. These are opportunities — either because nobody has done it well yet, or because you can do it better.

Examples of gaps worth taking:

- None of your competitors have a **video explainer** — adding one could increase time-on-page significantly
- Only one competitor has a **comparison table** — visitors researching options will stay on your page longer
- No competitor shows **pricing or starting rates** — transparency is a differentiator in most UAE markets
- Only two competitors have a **live chat or WhatsApp button** — a direct contact shortcut can lift conversions

Gaps are not automatic wins.

A section that is rare may be rare for a reason — it did not convert well for others. Test gap sections by adding them after launch and tracking time-on-page and click-through rate.

Step 6

Build Your Page Blueprint

Using your analysis, write the final ordered section list for your page. This is your blueprint — every person working on the page (designer, developer, copywriter) follows this document.

A completed blueprint looks like this:

Position	Section	Appears In	Priority	Notes
1	Hero	10 / 10	Essential	Headline + subheadline + single CTA button
2	Social Proof	8 / 10	Essential	Client logos or media mentions — builds instant trust

3	Services	10 / 10	Essential	Grid of 3–6 services with icons and short descriptions
4	How It Works	7 / 10	Essential	3-step numbered process — keep it simple
5	Testimonials	9 / 10	Essential	Minimum 3 quotes with name, company, and photo
6	FAQ	6 / 10	Recommended	Target PAA questions from your SERP analysis
7	CTA / Contact	10 / 10	Essential	Form or WhatsApp button — one clear action only
8	Footer	10 / 10	Essential	Navigation, legal links, social icons, contact details

Hand this to your designer as-is. A page blueprint with section names, priority ratings, and notes is a complete brief. A good designer or developer does not need anything else to start building the page.

Why This Works

You are not designing in a vacuum. Every section order you see repeated across 7 or more competitors has been tested by real visitors over years. Those businesses kept those sections in those positions because they worked — visitors stayed, engaged, and converted.

By following the validated pattern first, you remove the guesswork from your initial build. Once the page is live and getting traffic, you have a baseline to test against. That is when you start moving sections, adding gaps, and optimising based on your own data.

The three guides together. Site Structure tells you which pages to build. SERP Behaviour tells you what format each page takes. Page Structure tells you what sections go inside and in what order. Run all three before a single line of copy is written.
